

**METHOD AND SYSTEM FOR  
AUTOMATED INCIDENT TRAFFIC REPORTING AND DYNAMIC ROUTING**

ABSTRACT

5       A method, an apparatus, and a computer program are provided for dynamically routing traffic routs based on traffic reports. Utilizing current in-car navigation systems, a new implementation of that system can be developed where alternate routes can be plotted around varying traffic events.

10 By receiving radio or Radio Frequency (RF) communications regarding current traffic conditions, the in-car navigation system can be modified to plot alternate routes. Also, the in-car navigation systems could utilize computer memory to develop histories of events so that reoccurring traffic events

15 such as rush hour conditions can be avoided.
